Chapter 1

Introduction

1.1 What the App Does

Given an **EVP** audio file that is *specifically* is expected to contain a text message *encoded in binary* (like computers do), but using **Tap Code** as encoding system, applies a sequence of audio processing steps in order to attempt to extract a Text Message from it.

1.2 Typical Workflow at a Glance

- Open an audio file containing an **EVP**.
- Click on Process (or Re-Process if this one file has already been processed)
- Look at the **TOP-RIGHT** panel.
It will either say that “*no message was decoded*” OR
It will contain the text message that was decoded from the **EVP** audio.
- The TOP-LEFT panel will show a general log detailing what the processing was doing.
- You can also look at the sequence of “Filter Outputs”, right below the Input Wave Form.
Details about the result of each processing step are shown there.
